

## Dr. Rick's Radicle Mix. (Ask me about this stuff!)

These seedlings went a bit too long, but aside from being a teeny bit pale, they seem to love **Dr. Rick's Radicle Mix**. All six were in the **Radicle Mix**, before I transplanted them. In the photo, five are in their new containers and one is still in the seedling pot.

Now these pups are living in style, though I've held back the N-P-K in this mix so they don't grow too fast while I prep their next home – a beautiful clayey loam Mollisol prepped with **Dr. Rick's Bio Fantasy Mix**. Of course... we'll have some other support-species plants in the mix as well. We're all about polycultures.

We can help farmers create mixes like this one above – in bulk at affordable prices. You'll save money and you'll get a better product than commercially available brands currently offer.

Now, friendly reader, one final photo. I ask you, “Do these roots love **Dr. Rick's BioChar & Compost mix?**”

Methinx THEY DO!!! I dropped some into the bottom of my seedling containers – underneath my **Radicle Mix** – and the roots went crazy!!
